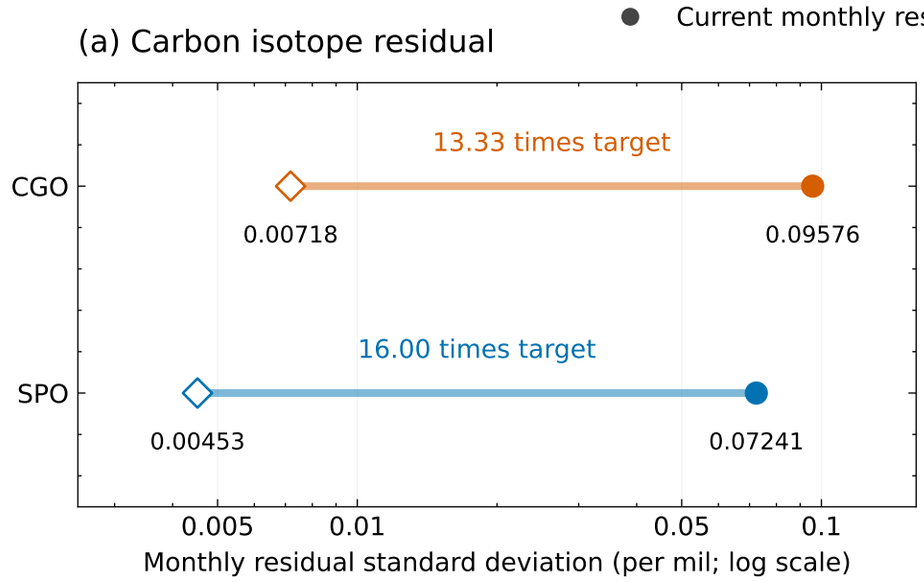
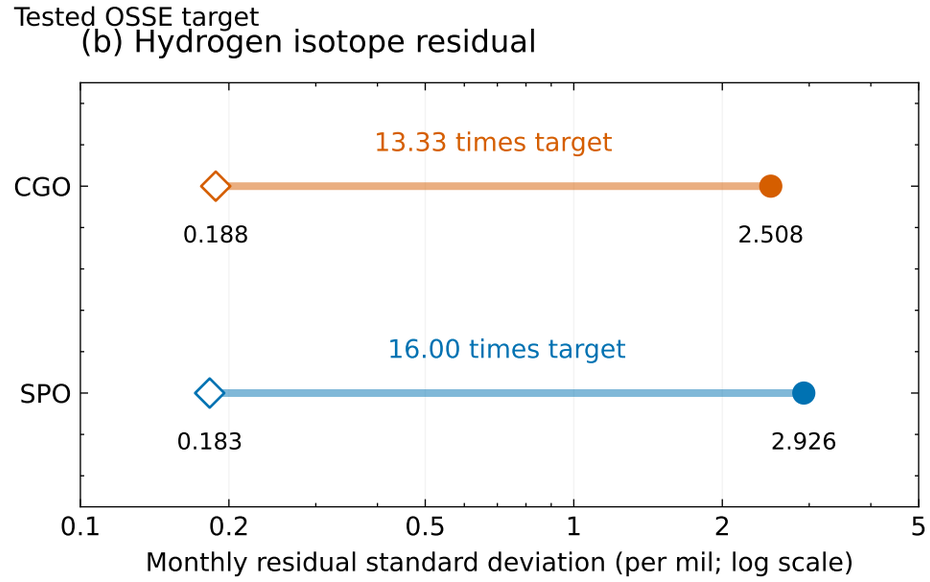
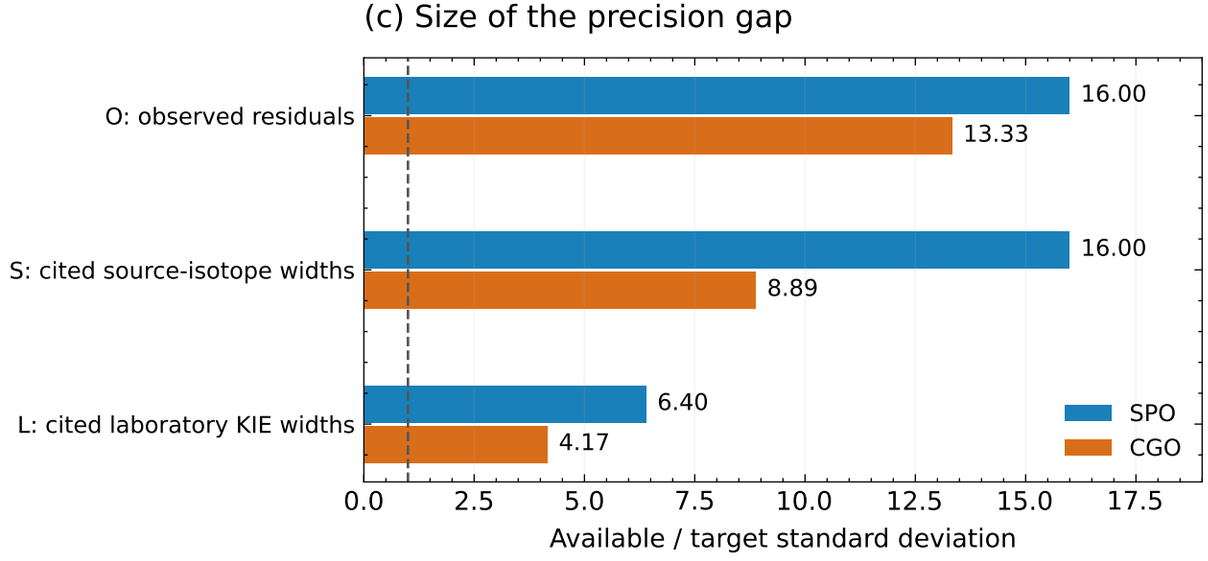
# Can available evidence meet the tested A/B discrimination conditions?

Current station residuals exceed the tested targets; several auxiliary constraints remain unverified.







## (d) Evidence still needed

**SOURCE / SINK**

Emission-seasonality errors and effective sink fractions: no verified station-specific precision at the target level.

**TRANSPORT**

NH-response lag target: SPO 1.43 days; CGO 1.71 days. Lag and response-weight precision remain unverified.

**OBSERVATION SUPPORT**

SPO: 33 paired months; median 3 D samples/month.
CGO: 29 paired months; median 2 D samples/month.

**INTERPRETATION**

Conditional OSSE success is established.
Real-data A/B discrimination is not yet demonstrated.

Targets: SPO all_x1.25; CGO all_x1.5. These are tested passing configurations, not proven feasibility boundaries.

O includes unexplained monthly variation, not instrument noise alone. S/L ratios compare cited widths, not measured station errors.
